

Educational Philosophy

In my teaching activity, my goal is to reach the maximum result with the minimum effort; what I want to transmit to my students is not only the content of the lesson, but also the method to study and to learn.

I think that lessons should be engaging and related to the real world; students must feel the passion of the teacher and should be looking forward to the next lesson. Never students should leave a lesson thinking that what they've learned has no practical application in real life.

I do not believe in predefined schemes, as we are all different and we learn in different ways; for this reason, I am very flexible and adaptive in my teaching technique; I always try to find the best approach to teaching, especially to those students that find difficult to learn and to retain the content taught during the lessons.

One of my preferred ways to teach is teaching by inquiry; instead of giving the answer to the students, I give them questions, and question after question I lead them to the right answer; my goal is to teach them how to think, how to focus on the process instead of focusing on the answer.

I am against micromanagement; thus, I plans unit but not individual lessons; I stay adaptive and I manage lessons and its objectives, according to the response, the level of understanding, and the inquiry that I get from the students.
